

SUMMER GASAWAY

Grove City, OH. | (760) 815 – 7487 | summer.gasaway@gmail.com | <https://gasawase.github.io/>

Education

University of Cincinnati

- **BS: IT**, Game Development and Software Development tracks / May 2025

GPA: 3.53

Relevant Coursework: Game Engine Lab (I and II), Contemporary Programming, Web Game Development, Network Game Development, Character Design & World Building, Intro to Animation

Korea University

- Study Abroad / August 2023 – June 2024

GPA: 3.44

Relevant Coursework: Data Structures, Computer Languages Lab

Key Skills

Languages: C#, SwiftUI, HTML/CSS, JavaScript, Python, Java, C++, HLSL/ShaderGraph, SQL, LUA

Software: Unity, Rider, Unreal Engine 4 (including Blueprints), Git, Jira, Visual Studio, Blender, Maya, Photoshop, Microsoft Suite

Professional Experience

Software Developer / May 2025 – Present

London Computer Systems (LCS)

- Developed new backend functionality for a check scanning feature in C# and .NET, extending an existing batch-scan system to support single checks from owners and vendors
- Wrote hand-crafted unit tests covering edge cases for the check scanning feature, prioritizing readable method and variable naming and inline comments to support future maintainability
- Contributed to an internal unit test generator tool, collaborating with another developer to improve consistency of auto-generated tests across different file types
- Diagnosed and resolved data retrieval issues by tracing and refining API endpoints, working directly with Case Review and customer support to reproduce and clarify reported bugs
- Adapted technical communication style across cross-functional teams including front-end, back-end, QA, and customer support

- Designed new database tables at project inception with a focus on minimizing impact to existing code and keeping schema clean and maintainable
- Managed task documentation and workflow tracking in Jira across the full development lifecycle

Software Developer (Co-Op & Student) / August 2020 – March 2023

Center for Simulation and Virtual Environments – University of Cincinnati

- Sole developer on *Hope After Hate*, an interactive VR experience guiding players through the life of a Holocaust survivor, for a significant portion of development, eventually onboarding and delegating to additional co-ops based on their strengths and the needs of each level
- Taught myself HLSL and Shader Graph to optimize texture rendering for *Hope After Hate*, shifting processing load from CPU to GPU and improving frame rate from ~15fps to 40-60fps on client hardware, making the experience viable for VR
- Translated scripts into fully realized interactive sequences in Unity Timeline, coordinating voice overs, animations, interactions, and dialogue triggers across levels for the *Medicaid Equity Simulation* and *Virtual Patient* projects
- Collaborated on and extended a pre-existing event sequencing system, building additional tools on top of it to support narrative-driven interactions across multiple projects
- Built interaction logic for a donning/doffing instructional simulation, implementing drag-and-drop mechanics tied to colliders that triggered sequential task progression
- Participated in client meetings, conducted lab walkthroughs, and demoed VR experiences, occasionally presenting technical decisions directly to stakeholders
- Managed version control with Git across collaborative and solo projects

Projects

- [*BookHarbour \(iOS App\)*](#) – A fully functional iBooks alternative built in SwiftUI that asynchronously loads epub metadata from a user-selected folder, renders book covers on a 2D bookshelf, and supports in-app reading with resizable text rendered from HTML. Includes book organization by title and author, detailed metadata views, custom tagging, and date-stamped reviews. Currently being redesigned as a 3D experience with drag-and-drop shelf customization.
- [*Blood Traveler*](#) — A short narrative action RPG built with a partner for a college project. Responsible for all interactions, event sequencing, and AI navigation. Features dialogue trees, cutscenes, quest progression, and item interactions across a time-travel story spanning about 5 minutes of gameplay.
- [*Multiplayer Demo*](#) — A solo-built multiplayer game using Unity's Netcode for GameObjects, exploring session hosting, player spawning, networked animations and health, and enemy stat tracking in a cooperative combat scenario.

Leadership & Extracurricular Activities

Preference Day Chair for Recruitment at Chi Omega Fraternity, Assistant Chair for Alumnae Relations at Chi Omega Fraternity, captain of junior varsity lacrosse team in high school
